Glycosyltransferase IgtD (AAR91314) can be obtd. by expression of the lgtD coding sequence in recombinant host cells. A method for adding GalNAc or GlcNAc betal-3 to Gal comprises contacting a reaction mixture contg. activated GalNAc or GlcNAc to an acceptor moiety comprising a Gal residue in the presence of LgtD. Oligosaccharides can be produce that, when attached to non-toxic lipids, are useful for Neisseria vaccine prepn. Blood group core oligosaccharides, and mimics of lacto-N-neotetraose, gangliosides and saccharide portions of globoglycolipids can also be produced using the enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding glycosyl transferase(s) - used in the diagnosis of infection with Neisseria and for the biosynthesis oligo:saccharide(s)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nakagawa

                                                                                                                                                                                                                                                                                                              A method has been developed of expressing a glycosyltransferase in a C host cell. The method comprises introducing into the host cell a nucleic acid encoding the glycosyltransferase and incubating the host cell under conditions appropriate for expression of the glycosyltransferase, where the host cell substantially lacks a protease that cleaves polypeptides between two consecutive positively charged amino acid residues. The glycosyltransferase can be used in in vitro production of collososyltransferase can be used in in vitro production of collososyltransferase can be used in in contential therapeutic agents for use in the manipulation of cell-cell recognition events, particularly adhesion of bacteria and viruses to mammalian cells and leukocyte-centodial cell interaction through selectins in inflammation. The method provides more readily recoverable active glycosyltransferases. The present sequence represents a C-terminal peptide from Neisseria
                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                               Query Match
Capsular gene cluster; serotype 1; polysaccharide biosynthesis;
                          CpslK protein which has glycosyltransferase activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The proteins AAY68950-69 are encoded by the capsular gene cluster of Streptococcus suis serotype 2. The genes in this cluster are involved in polysaccharide biosynthesis of capsular components and antigens. The proteins are involved in regulation (CpsA), chain length determination (CpsB, CpsC), export (CpsC), and biosynthesis (CpsE, CpsF, CpsG, CpsH, CpsK). The capsule confers bacterium resistance to complement-mediated opsonophagocytosis. The gene cluster is used as a source of probes and primers for serotype-specific detection of S. suis and is also useful for recombinant production of the proteins. The proteins are then useful for producing antigens that can be used in vaccines, for controlling or eradicating a Streptococcal disease, in humans or animals, e.g. against S. suis in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Capsular gene cluster; serotype 2; polysaccharide biosynthesis; capsular component; antigen; regulation; chail length determination; complement-mediated opsonophagocytosis; serotype-specific detection; antigen; vaccine; Streptococcal disease; ORF 2Z; ORF 2Z; ORF 2Z; Cps2A; Cps2B; C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WO200005378-A2

P. abyssi a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial
                                                                                                                                                                                   Sequence

Novel exopolysaccharides can be produced by transforming lactic acid bacteria which produce exopolysaccharides with DNA encoding at least one enzyme from the eps operon. The new exopolysaccharides are useful for thickening drinks, liquid desserts, yoghurts, soups,
                                                                                                                                                                                                                                                      A chromosomal DNA sequence representing practically the whole eps (exopolysaccharide biosynthesis) operon from Streptococcus thermophilus strain Sfi6 (deposited as CNCM I-1590) was isolated. The sequence contained 14 open reading frames, one of which was located on the complementary strand. The present sequence is decoded from the epsH open reading frame. The EpsH protein is

                                                                         encoded by the Rfbv ORF of the rfb cluster from Salmonella typhimurium and is probably a glycosyl transferase. The EPS are useful for thickening e.g. drinks, liquid desserts, yoghurts, soups, ice-creams, coffee creams, sauces, mayonnaise.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Streptococcus thermophilus; operon; exopolysaccharide; synthesis; open reading frame; thickening; drink; liquid dessert; yoghurt; sauce; ice-cream; coffee cream; mayonnaise; glycosyl transferase.
                                                                                                                                        This sequence represents the protein encoded by the epsI gene from the Streptococcus thermophilus exopolysaccharide (EPS) synthesis operon. The operon has 13 open reading frames (ORF) designated epsA-M encoding proteins AAW22169-81. This protein has 24% identity to a protein

 of forming a bond (alpha or beta-isomer) between C-1 (carrying the reducing aldehyde function, of an activated D-galactose pyranose), and a phosphate on a lipophilic or proteinaceous primer. Stepwise synthesis of EPS occurs with, in each step, addition of a new sugar unit, through its hemi-acetyl function, to an alcoholic hydroxyl of a second sugar
                                                                               exopolysaccharides (EPS). These enzymes are designated EPS1-EPS10. and ere encoded by open reading frames eps1-eps10. The enzymes are isolated from Streptococcus thermophilus strain $fi39$. The proteins are used in a method for the synthesis of EPS, which includes at least one step
                                                                                                                                                                              Claim 3;
                                                                                                                                                                                                         New recombinant enzymes for synthesis particularly in lactic acid bacteria, fermented milk products
                                                                                                                                                                                                                                                                                                                       Stingele F,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      unit, present at the end of a chain of sugar residues bonded to the primer. EPS1 to EPS4 are used to elongate the EPS Chain, and to regulate EPS production, EPS5 creates new bonds between saccharides, EPS6 is used in the biosynthesis of EPS, EPS7 and EPS8 are beta-glycosyltransferases, EPS9 is a transporter of repetitive units, and EPS10 catalyses the conversion of a pyranose form of a beta-D-galactose to the furanose form. The EPS enzyme are used to improve properties of foods, particularly fermented milk products such as yoghurt and cheese,

The enzymes catalyse the formation of specific intersugar bonds. The enzymes catalyse a process that includes at least one step of forming a bond (in alpha or beta anomeric form) between Cl, carrying the reducing aldehyde group of an activated D-Galp (galactose in pyranose form), and a phosphate group on a lipophilic or proteinaceous primer. The enzymes are used to produce EPS that have antitumor or probictic properties or are used in foodstuffs to improve organoleptic qualities and flavour. When expressed by lactic acid bacteria. EPS impart a free-flowing character and/or a smooth, creamy texture to acidified milk products (yoghurt or cheese).
The sequences given in AAB47426-27 are encoded by a fragment of the plasmid derived from L. lactis subspecies cremoris Ropy352. The EPS plasmid is about 32 kb in size and encodes at least 13 active genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The enzymes encoded by these genes allow the bacteria to produce an exopolysaccharide, designated EP3352. When EP3352 is expressed in or added to milk, it imparts highly desirable sensory characteristics to the milk, including making the milk very thick, with a very smooth mouth-feel, and slightly sweet with an obvious chewable-bite. Open reading frames (ORF's) M and N show homology to glycosyltransferase involved in EP3352 biosynthesis. L. lactis cremoris Ropy352 is deposited with the USDA-ARS-NCAUR-NRRL as deposit accession number NRRL B-30229. EP3352 is useful for thickening a liquid selected from milk, a milk-based liquid, a whey-based liquid, a soy-based liquid, and a fruit-juice. It is also useful as an additive in pharmaceutical products healthy care products and coating accounts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DB

Sequence 3, Application US/08312387B Patent No. 5545553
GENERAL INFORMATION:

NUMBER OF SEQUENCES: 1
CORRESPONDENCE ADDRESS:

ADDRESSEE:

Klauber & Jackson

APPLICANT: Gotschlich, Emil C.
TITLE OF INVENTION: GLYCOSYLTRANSFERASES FOR BIOSYNTHESIS OF
TITLE OF INVENTION: OLIGOSACCHARIDES, AND GENES ENCODING THEM

```
